1.USER STORIES

1.1 Document Purpose

Version 2.0

Written by: Chelsea (Project Manager/Documentation Lead)

Last edited: 16th April 2025

Purpose: This document outlines the core user stories for the Event Management System. It is structured to support our chosen agile methodology and incremental delivery across the defined user roles. Each story was written to reflect the specific system functionality from an end-user perspective and adheres to INVEST principles (Independent, Negotiable, Valuable, Estimable, Small and Testable).

1.2 Format Standard

Each user story follows the format:

“As a [type of user], I want to [goal] so that [benefit].”

1.3 Actor Overview

This project includes the following user types:

- General Users (attendees)
 - Event Organisers
 - System (backend operations)
 - Administrators
-

1.4 User Stories by Actor

1.4.1 General Users

Users interact with the platform primarily to register, browse, and attend events. Their experience should be seamless, intuitive, and responsive across all devices.

- As a user, I want to register for an account so that I can access personalised features.
- As a user, I want to log in and log out securely so that I can protect my account information.

- As a user, I want to view upcoming events so that I can choose which ones to attend.
- As a user, I want to search and filter events by date, type, or location so that I can find relevant options quickly.
- As a user, I want to register or purchase tickets for events so that I can confirm my participation.
- As a user, I want to view a history of events I've registered for so that I can track my engagements.
- As a user, I want to receive email or in-app notifications about event changes or confirmations so that I stay updated.

1.4.2 Event Organisers

Organisers use the platform to manage event creation, attendee lists, and real-time updates. Their interaction must support efficient content creation and administrative control.

- As an organiser, I want to log in to my organiser account so that I can manage my events.
- As an organiser, I want to create new event listings so that users can see what I'm offering.
- As an organiser, I want to edit or cancel events so that I can keep information accurate.
- As an organiser, I want to view the list of attendees per event so that I can prepare accordingly.
- As an organiser, I want to send event updates to registered users so that they stay informed.
- As an organiser, I want to generate basic reports on event attendance so that I can evaluate
- success.

1.4.3 System-Level Functionalities (*Non-Human Actors*)

These user stories reflect core system operations required to support user-facing features. Though they aren't user-initiated, they are still essential to functional integrity.

- As the system, I must validate user input on all forms so that data is consistent and error-free.
- As the system, I must send confirmation emails after registration or ticket purchases so that users receive proof of action.
- As the system, I must implement secure authentication so that user data is protected.
- As the system, I must provide role-based access so that users only access relevant features.
- As the system, I must log user interactions so that audit trails are maintained.

1.4.4 Administrators

Administrators manage system integrity and user governance.

As an admin, I want to monitor system-wide activity so that I can ensure smooth operations.

- As an admin, I want to review and moderate events so that I can remove inappropriate or duplicate content.
 - As an admin, I want to manage user accounts so that I can suspend or deactivate as necessary.
-

1.5 Document Note

- This user story list is expected to evolve with stakeholder feedback and ongoing sprint retrospectives (i.e. changes in the Rubric or any updates from the Subject Coordinator)
- Non-functional requirements (e.g. performance, usability, accessibility) will be addressed separately (should it be required in the final submission).

2. PROGRESS REPORT

2.1 Project Overview

This group project involves the design and development of an Event Management System that is modelled after platforms like Eventbrite or Humanitix. The application allows for general users to register and log in, browse events, purchase tickets (General Registration or VIP/Premium Registration), and receive event notifications. Event organisers will be able to create and manage events, view attendees, approve or reject registrations and access basic analytics and payment features.

The system is being developed as part of CSIT314: Systems Development Methodologies and follows an iterative development lifecycle, with agile practices embedded throughout the semester's sprint-based schedule.

2.2 Development Methodology

After evaluating multiple project management models, our team adopted **Scrum** due to its ability to support a structured, iterative delivery within the constrained academic timeframe of the semester. Scrum allows for an emphasis on short, defined sprints that are aligned with the weekly pace of the semester which allows for the incorporation of regular feedback, the track of progress incrementally and to adapt to shifting workloads. The methodology's core principle - sprint planning, role accountability, and backlog visibility were all essential for managing a group with variable participation levels and overlapping responsibilities.

2.3 Sprint Schedule

2.3.1 Sprint Calendar

Sprint	UOW Week	Dates	Focus
1	Week 4	Mar 24 – Mar 30	- Team formation confirmed - Project roles allocated - Scrum methodology selected - Initial sprint schedule drafted and circulated via Discord - GitHub setup discussed
2	Week 5	Mar 31 – Apr 6	- GitHub repository established - Folder structure and backend scaffold (Express.js) initiated. - Frontend development - Initial user stories drafted
3	Week 6	Apr 7 – Apr 13	- UML diagrams (Use Case & Class) submitted. - Progress Report (Part 1)
4	Week 7	Apr 14 – Apr 20	- Final preparations for Part 1 submission. - Figma mockups submitted - Dummy data script drafted - HTML frontend submitted - Report formatting and system evidence consolidated
Break	Recess	Apr 21 – Apr 27	Semester Recess - <i>no formal deliverables</i> . Suggested time for refining front/backend code, catching up on deferred tasks, and reviewing documentation.
5	Week 8	Apr 28 – May 4	- HTML/CSS pages finalised - Backend routes initiated - User manual structure outlined - CI/CD pipeline configuration begins.
6	Week 9	May 5 – May 11	- System integration underway - Dummy data injected - Frontend-backend connection tested - Component-level testing initiated - Manual visuals and draft completed.
7	Week 10	May 12 – May 18	- Core functionality reviewed - QA feedback loop initiated - Responsive UI finalised - Documentation consolidated - GitHub Actions explored for CI/CD pipeline

8	Week 11	May 19 – May 25	● Final testing across devices and browsers ● User manual completed ● Full system walkthrough documented ● All key features locked and verified.
9	Week 12	May 26 – Jun 1	● Polish sprint ● Backend logic refined ● Test cases documented ● All visual assets and scripts finalised ● Report appendix consolidated.
10	Week 13	Jun 2 – Jun 8	Final system deployment and project submission. All components (code, docs, user manual and evidence artifacts) submitted.

Sprint planning was aligned to the academic calendar, with each development block mapped to UOW Weeks 4-13.

2.3.2 Sprint Schedule Planning - Evidence of Early Coordination

To ensure clear sprint planning from the outset, the project began with a preliminary development plan authored and shared with the group on **28 March 2025**. This was presented in a Google Doc titled *CSIT314 Overview* and included the initial sprint calendar, methodology notes (Scrum), and workflow breakdowns. Version history from Google Docs confirms the timeline, with the Scrum calendar introduced at **21:53 on 28 March**, prior to Week 5.

This early planning served as the structural foundation for project direction and team task allocation. The same document was later uploaded to the GitHub repository as the Group Quick Guide (group_quickguide.pdf and group_quick_guide.md) and referenced during team meetings and Discord communication.

Visual evidence includes:

- Screenshot of the version history in Google Docs confirming the plan was written on 28 March
- Associated GitHub file upload history confirming inclusion in the /docs/ directory
- Discord log (28 March) showing the Quick Guide shared with the group, with roles and sprints explained

This early, transparent setup enabled the GitHub structure, user story drafting, and meeting minutes to begin immediately.

Figure 1. Screenshot of Google Docs version history showing the proposed sprint calendar and development methodology created on 28 March 2025.'

Figure 2. GitHub commit log showing the upload of the initial planning document into the /docs/ directory, confirming formal inclusion in the project repository.

Figure 3. Discord message log from 28 March 2025 showing the Quick Guide shared with team members, detailing assigned roles and sprint objectives. (Note: "mommy" is the project manager's Discord display name - Chelsea.)

2.4 Technology Stack & Frameworks

The Event Management System is being developed using a lightweight, accessible technology stack that is tailored to the constraints of a semester-based team project. The frontend is being constructed using HTML and CSS and is based on high-fidelity mockups created in Figma. There were initial plans to include JavaScript for dynamic frontend interactivity, but as of this sprint, there has been no client-side scripting implemented as of yet.

The backend has been scaffolded using Node.js with the Express.js framework, with the intention of providing a modular structure and the foundation for RESTful API routing. No functional routes have been completed but there are placeholders set for user registration and login endpoints once they've been established.

Although MongoDB was originally considered for the backend data management, there has been no live database instance or schema implemented to date. Instead, a dummy script - structured as a JavaScript file - was developed by the Project Manager to simulate NoSQL-style collections of users and events. The script is intended to support integration testing and frontend alignment for the upcoming sprints.

All source files, documentation, and sprint planning materials are maintained via GitHub.

2.5 Tools Used

Development and coordination were managed through a combination of version control, collaborative platforms, and lightweight development tools, structured within an iterative sprint model.

GitHub served as the central platform for code management, documentation, and sprint task tracking. The repository used for version control is titled csit314-event-management-system (private GitHub repo maintained by the Project Manager). Folder structures for frontend and backend components were scaffolded early to support modular expansion.

Team communication occurred primarily through Discord, which supported asynchronous check-ins, deadline coordination, and internal updates.

While GitHub Actions for CI/CD was considered during early planning, priority was placed on establishing a functional codebase and completing documentation milestones for this sprint.

2.6 Testing Strategy

A staged testing approach has been planned for the system to align with the project's sprint cycle and incremental feature development. Due to delays in the delivery of both frontend and backend components, formal testing has not yet commenced as of **Sprint 3**.

2.6.1 Phase 1: Unit Testing

Planned - Sprint 4 (Week 8) to Sprint 5 (Week 9)

Unit testing will begin once key backend routes - such as user registration, login, and event creation - have been implemented. Testing will be conducted manually using Postman, verifying each endpoint's response status, input validation, and basic error handling. This phase will confirm the stability of the API prior to frontend integration.

2.6.2 Phase 2: Integration Testing

Planned - Sprint 6 (Week 10) to Sprint 7 (Week 11)

Following the development of functional frontend components, integration testing will validate data flow between the frontend interface and backend endpoints. This will include testing user login, event search, and registration workflows using simulated user inputs and mock data. Tests will be conducted locally under controlled conditions.

2.6.3 Phase 3: System Testing and QA

Planned - Sprint 7 (Week 11) to Sprint 8 (Week 12)

System-level testing will evaluate end-to-end functionality, usability, and responsiveness. Manual QA will be conducted by the assigned quality assurance coordinator, with test cases designed to validate system behavior against user stories. Logs, findings, and resolved issues will be documented and included in both the final report and user manual.

Testing will be performed manually due to the project's limited scope and the absence of automated testing infrastructure. Functional outputs such as form validation, route responses, and user flows will be manually verified and documented through screenshots. These will be included in the final submission - primarily within the user manual and if needed in the appendix - as evidence of successful implementation.

3. UML Diagrams

The following UML diagrams were developed to model the proposed system. These visual artefacts reflect the system’s structure, behavioural logic, and object interactions across all core user roles.

3.1 Use Case Diagram

The Use Case Diagram identifies the major system functionalities from the perspectives of the General User, Organiser, and Administrator, along with external services such as the Notification Service and Payment Gateway. It demonstrates how users interact with features such as registration, event browsing, booking, content management, and system moderation.

Figure 4. Use Case Diagram for the Event Management System, depicting interactions between actors and system functions, including common actions, extensions, and external services.

Name	Technology Service
Description	Users can find, book, and manage events. Organisers can create and handle their events, and administrators can manage the system and user accounts.
Actors	• General User • Organiser • Administrator • Notification Service • Payment Gateway
Trigger	Actions like browsing events, trying to book a ticket, or an organiser creating a new event.
Normal Flow	1. User Login or registration 2. General User explores events 3. User selects an event and books tickets 4. User pays for the event 5. System sends booking confirmation 1. Organiser login 2. Organiser creates an event 3. Organiser can accept or reject any attendees 4. Organiser makes updates on event details 5. Administrator can cancel events or suspend accounts
Alternative Flow	1. Suspicious event, payment denied 2. Administrator suspends a user account

3.2 Class Diagram

The Sequence Diagram provides a detailed view of object-level interactions across different user roles. It outlines the sequence of calls and responses between UI elements, backend services, APIs, and the notification/payment gateways during registration, event management, ticket purchasing, and system-level admin controls.

Figure 5. Class Diagram showing core entities and their relationships within the Event Management System, including inheritance, aggregation, and object composition.

- **Admin:** can manage accounts, review events, generate reports and suspend accounts.
- **Organiser:** can register, generate reports, create events, manage registrations, edit events, view attendees, and send updates.
- **Client:** can register, filter events, get their booking history, and book events. The user might live at an Address, which has details like street, city, state, postal code, and country (the user chooses to put the address or not). A Client can make many Bookings, booking has a time, date, and a booking type.
- Event: has details like a price, date, time, location, status, and a unique ID.
- Filter: can be used to search for events based on price, date, and location.
- Account: also has a status (active or not) and information about the user.

3.3 Sequence Diagram

The Class Diagram models the system's internal structure by outlining class relationships, attributes, and methods for key entities such as User, Organizer, Client, Event, Booking, and Admin. It includes inheritance between user roles and associations with data structures like Address and Account.

Figure 6. Sequence Diagram outlining functional flows across user actions and backend services, including conditional and alternative logic branches (e.g. VIP ticket selection, registration approval).

- **Users** can register, log in, log out, view, search events, see booking history, and book events (which involves payment). When users need to book an event, they have to choose a VIP or an ordinary ticket. After they pay, the system sends a confirmation email via the notification API.
 - **Organisers** can check, accept, reject registrations and generate reports. When organizers need to update event details and accept or reject attendees, the system sends a confirmation email via the notification API.
 - **Admins** can generate reports, review/cancel events, and manage user accounts. When the admin cancels an event, the system sends a confirmation email via the notification API.
-

4. Group Roles and Assignments

Each team member was assigned a primary role and supporting responsibilities to ensure delivery of all project requirements from **Sprint 1 (Week 5)** through to **Sprint 9 (Week 13)**. Roles were allocated in response to required deliverables, taking into account individual strengths and group planning priorities. Support roles were included to promote accountability and allow flexibility in the event of delays or unforeseen workload imbalance.

4.1 Chelsea - Project Manager / Documentation Lead / Backend Architect

Primary Responsibilities:

- Coordinate sprint planning, team deadlines, and task delegation
- Maintain GitHub repository and file structure:
 - Establish /frontend/, /backend/, /docs/, /diagrams/, and /development_plan/ directories
 - Set up .gitignore, config files, and project README
 - Create and manage the GitHub Projects board
- Scaffold backend:
 - Create server.js, and structure folders for routes/, controllers/, models/
- Develop and maintain the dummy data script (mock user and event data)
- Author all meeting minutes (Weeks 4-13) in both Markdown and PDF
- Write and compile the Progress and Final Reports, including:
 - Development methodology
 - Sprint calendar
 - Functional/user requirements
 - Testing strategy
 - Challenges encountered
 - System progress summary
 - Roles and contribution overview
- Finalise the contribution table and package documentation for submission

Support Responsibilities:

- Provide contingency support across backend, frontend, and documentation
- Format or author the user manual if required
- Conduct QA testing and assist with final sprint deliverables

4.2 Tamim - UML Specialist / Systems Planner

Primary Responsibilities:

- Create and submit all UML diagrams: Use Case, Class, and Sequence
- Provide descriptive write-ups for each diagram for report inclusion
- Ensure diagrams align with actual backend and frontend structure

Support Responsibilities:

- Cover the ERD if not delivered by the backend developer
- Assist with layout and formatting of visual documentation

4.3 Sara - Backend Developer / Logic Integrator**Primary Responsibilities:**

- Implement backend routes and logic for:
 - User registration and login
 - Event creation, ticket booking, and payment simulation
- Organise backend file structure (routes/, controllers/, models/)
- Design and submit the ERD or database schema
- Provide backend output, screenshots, and implementation notes for inclusion in the final documentation

Support Responsibilities:

- Ensure backend logic is compatible with UML and frontend design
- Assist with dummy data testing or documenting backend functionality

4.4 Zuhor - Front End Developer / UI Engineer**Primary Responsibilities:**

- Build responsive frontend pages using HTML and CSS
- Pages include: Login, Register, Event Listing, Event Detail, Booking Confirmation, Organiser Dashboard
- If working code is not delivered, provide full Figma mockups demonstrating intended user flow
- Upload screenshots or mockups to /docs/frontend or directly into the project repo

Support Responsibilities:

- Provide UI visuals for user manual and report
- Coordinate with QA and manual coordinator for usability documentation

4.5 Hafiza - QA Assistant / User Manual Coordinator**Primary Responsibilities:**

- Draft and format the user manual:
 - Step-by-step task guides
 - Screenshots and annotated UI walkthroughs
- Conduct informal QA testing (Weeks 10-12):
 - Test frontend/backend functionality
 - Identify usability issues and log feedback
- Draft contribution table (finalised by Project Manager if incomplete)

Support Responsibilities:

- Act as a support float across tasks and documentation as needed
- Collaborate with frontend dev on UI documentation
- Assist in screenshot collection, testing feedback, and final formatting

4.6 Section Note

While roles were initially allocated to ensure balanced workload distribution, the project required ongoing flexibility due to shifting availability and incomplete deliverables. Tasks were adjusted as needed to maintain progress, with cross-role support introduced to cover gaps across frontend, backend, and documentation streams.

The revised sprint schedule and redistributed responsibilities reflect a pragmatic approach focused on delivering a functional and demonstrable system within the given timeframe.

5. Current Progress and System Evidence

5.1 Functionalities Designed and/or Implemented

The group has completed foundational planning for the Event Management System, including detailed user stories segmented by system role (User, Organiser, Admin). Functional requirements have been scoped and aligned to the agile methodology adopted.

As of end of Sprint 3 (Week 7):

- High-fidelity Figma mockups are complete for both General User and Organiser
- Static HTML/CSS scaffolding has been initiated for core frontend pages for both General User and Organiser
- Backend structure has been scaffolded.
- Dummy data generation scripts are in development
- ERD diagram has been completed
- Use Case Diagram, Class Diagram and Sequence Diagram with case descriptions

Functionalities scoped or in progress:

- User Registration/Login
- Event Listing & Browsing
- Ticket Booking (General + VIP)
- Organiser Event Management Dashboard
- Admin Moderation Functions

5.2 Front-End and Back-End Components Developed

Front-End:

- High-fidelity Figma prototypes completed (user and organiser views).
- HTML/CSS pages initiated for login, registration, event listing, organiser dashboard, and booking screens.
- No JavaScript or frontend logic has been implemented as of Sprint 3.

Back-End:

- Project scaffolded using Node.js and Express.
- Folder structure includes: routes/, controllers/, models/, middleware/, config/, and utils/.
- server.js file present, but does not yet contain functional logic.
- A dummy data script is being written to simulate MongoDB-style collections (users/events) for integration testing.

5.3 Database Schema and Design Work

A class diagram was developed to outline the system's object relationships and inform the structure of key entities. This guided the construction of the ERD, which formalises relational mappings and supports logical schema design.

Figure 7. Final database schema used for implementation, showcasing logical data relationships and foreign key mappings between core system entities. Refer to **Appendix A** for the final ERD, for entity descriptions, and the unused draft submission not used due to inconsistencies and unresolved structural issues.

Planned data relationships:

- Users ↔ Bookings
- Organisers ↔ Events
- Events ↔ Attendees (via Bookings)
- Admin ↔ System-level controls (e.g., reports, account status)

Once finalised, the ERD will inform NoSQL schema structure and guide backend implementation.

5.4 Challenges Encountered and Mitigation Strategies

The group encountered several issues related to participation, time management, and deliverable delays. These include:

- Lack of functional frontend components (JavaScript logic pending)
- Backend logic unimplemented beyond project scaffold
- No ERD or database schema submitted as of Week 7
- Compressed testing timeline due to incomplete dependencies

Mitigation strategies include:

- Creating high-fidelity UI mockups to simulate end-user flows
- Preparing dummy data scripts to mimic MongoDB objects for early testing
- Prioritising documentation and project artefact quality for submission resilience
- Reallocation of core tasks to active contributors where necessary

Despite these setbacks, the project remains viable for completion if planned sprints are executed on time. All project resources are tracked via GitHub and updated regularly.

5.5 Evidence of System Construction

The following visual artefacts and structural evidence confirm the progress of development as of Sprint 3:

Figure 8. Root GitHub repository structure showing main folders (backend, frontend, documentation), README, and project setup. This screenshot demonstrates initial repository scaffolding handled by the PM, including version control and project visibility.

Figure 9. Backend directory structure within the GitHub repository, showcasing modular Express.js implementation. Each subfolder represents a key architectural

responsibility (e.g., controllers, middleware, routes), demonstrating scalable backend development practices.

Figure 10. Frontend directory structure showing static HTML, CSS, and JS assets, with index.html as the base template for rendering initial UI screens.

Figure 11. Preview of rendered static login page aligned to UI design from Figma mockups in **Figure 14**. *Full-sized screenshots of frontend pages is provided in Appendix B*

```

1 // generate_dummy_data.js
2 // hi team (and tutor, if you're reading this lol) @
3 // this script generates mock organisers, events, and bookings for our CSIT314 project!
4 // it's built with @faker-js/faker, which lets us spit out data that *looks* real (but don't worry, it's not)
5 // **NOTE** if you're testing with this on your own laptop and it's not working, run:
6 // npm install @faker-js/faker
7 // i am not tech support <3
8
9 const { faker } = require('@faker-js/faker');
10
11 const organisers = [];
12 const events = [];
13 const bookings = [];
14
15 // make 10 event organisers because honestly 1 or 2 was not gonna cut it
16 for (let i = 1; i <= 10; i++) {
17   organisers.push({
18     id: `org${i.toString().padStart(3, '0')}`,
19     name: faker.person.fullName(),
20     email: faker.internet.email(),
21     password: faker.internet.password(12),
22     role: 'organiser',
23   });
24 }
25
26 events.push({
27   id: `event${i.toString().padStart(3, '0')}`,
28   title: `${faker.music.genre()} Night at ${faker.location.city()}`, // very real very authentic
29   description: `Join us for a night of ${faker.music.genre()} featuring ${faker.person.fullName()} and other local legends.`,
30   date: faker.date.future().toISOString(),
31   location: faker.location.city(),
32   organiserId: `org${i.toString().padStart(3, '0')}`,
33   capacity: faker.number.int({ min: 80, max: 300 }),
34   ticketsAvailable: faker.number.int({ min: 10, max: 300 }),
35 });
36
37 // bookings. 50 of them. because why not.
38 for (let j = 1; j <= 50; j++) {
39   bookings.push({
40     bookingId: `bk${j.toString().padStart(3, '0')}`,
41     userId: faker.internet.username(),
42     eventId: `event${faker.number.int({ min: 1, max: 10 }).toString().padStart(3, '0')}`,
43     status: faker.helpers.arrayElement(['confirmed', 'pending', 'cancelled']),
44   });
45 }
46
47 // proof-of-life preview!! if you're screenshots, you're good with this slice
48 console.log(`\n Sample Organisers:\n`, JSON.stringify(organisers.slice(0, 2), null, 2));
49 console.log(`\n Sample Events:\n`, JSON.stringify(events.slice(0, 2), null, 2));
50 console.log(`\n Sample Bookings:\n`, JSON.stringify(bookings.slice(0, 5), null, 2));
51
52 console.log(`\n Dummy data successfully generated. Add to CI/CD pipeline for seeding and auto-testing. Love you, bye :D`);
53

```

Figure 12. Screenshot of dummy data script used to simulate user/event objects.
Script excerpt provided in Appendix C

Figure 13. /docs/ directory with development plan, meeting minutes, and user stories. This structure was created and maintained by the PM to streamline documentation access and submission readiness.

Figure 14. Figma UI mockups showing multi-page flow for both user and organiser roles. *Individual high-resolution versions of the above UI mockups are included in Appendix D.*

Figure 15. GitHub commit history showing contribution activity by auweii (Chelsea, Project Manager). This log reflects full responsibility for repository setup, backend scaffolding, documentation, and overall project management. *For full commit history, see Appendix E.*

5.6 Plan for Remaining Iterations

Development in Sprints 4 to 9 will transition from scaffolding to implementation, testing, and documentation finalisation. The focus will be on feature completion, frontend-backend integration, QA, and final deployment. The sprint schedule is intentionally designed to overlap testing and documentation, allowing parallel progress and risk mitigation. If additional delays occur, tasks will be redistributed or presented via static UI and documentation fallback.

Break	Recess	Apr 21 – Apr 27	Semester Recess - <i>no formal deliverables</i> . Suggested time for refining front/backend code, catching up on deferred tasks, and reviewing documentation.
5	Week 8	Apr 28 – May 4	• HTML/CSS pages finalised • Backend routes initiated • User manual structure outlined • CI/CD pipeline configuration begins.
6	Week 9	May 5 – May 11	• System integration underway • Dummy data injected • Frontend-backend connection tested • Component-level testing initiated • Manual visuals and draft completed.
7	Week 10	May 12 – May 18	• Core functionality reviewed • QA feedback loop initiated • Responsive UI finalised • Documentation consolidated • GitHub Actions explored for CI/CD pipeline
8	Week 11	May 19 – May 25	• Final testing across devices and browsers • User manual completed • Full system walkthrough documented • All key features locked and verified.
9	Week 12	May 26 – Jun 1	• Polish sprint • Backend logic refined • Test cases documented • All visual assets and scripts finalised • Report appendix consolidated.

The sprint schedule is intentionally designed to overlap testing and documentation, allowing parallel progress and risk mitigation. If additional delays occur, tasks will be redistributed or presented via static UI and documentation fallback.

5. Meeting Records and Team Contributions

5.1 Meeting Records

5.1.1 Week 4 Meeting Minutes

Project Title: Event Management System

Prepared by: Chelsea (Project Manager/Documentation Lead)

Date: Friday, 28th March, 2025

Time: 10:00PM

Location: Discord (asynchronous discussion via text channel)

Attendees:

- Chelsea (Project Manager / Documentation Lead)
- Tamim (UML + Planning Diagram Specialist)
- Zuhor (Frontend Developer + UI Lead)
- Hafiza (QA Assistant / User Manual Coordinator)
- Sara: - No contact received

Agenda:

- Confirm group formation and assign roles
- Establish development methodology and tools
- Review proposed sprint schedule and deliverables
- Allocate responsibilities for initial report and system planning
- Determine next steps ahead of Progress Report (Part 1) submission

Key Decision and Actions

Area	Decision/Action	Assigned	Status/Notes
Group Formation	Group officially formed during Week 4	Team	Completed
Project Manager Assigned	Chelsea nominated and confirmed as PM	Team	Completed
Methodology	Scrum selected for iterative dev and weekly accountability	Team	Completed
Sprint Schedule	Drafted by Chelsea - spans 6 sprints from Week 4 to Week 10, will be revised	Chelsea	Circulated to group
Version Control	GitHub selected for repo, file sharing, and progress tracking	Team	Setup scheduled, Week 5

Frontend Setup	Zuhor assigned to frontend development (login/register pages to begin in Sprint 2)	Zuhor	Pending Week 6
Backend Setup	Backend developer not yet assigned, initial set up to be discussed Week 5	Team	Pending
UML Diagrams	Tamim assigned to create use case and class diagrams	Tamim	Rough drafts due Week 6
UI Mockups	Figma discussed as optional tool for UI layout	Zuhor	Not started
User Stories	Chelsea to begin drafting key user stories for Part 1 submission	Chelsea	Begins Week 5
User Manual	Hafizxa to outline structure and planning notes by Week 7	Hafiza	Scheduled
Progress Report Prep	Chelsea to lead report writing (Part 1) - including user stories, methodology, and meeting records	Chelsea	Begins Week 5

Outcomes

- Group roles provisionally assigned
- Scrum methodology confirmed
- Sprint outline proposed and reviewed
- Deliverables for Progress Report (Part 1) allocated

Action Items for Week 5:

- Chelsea: Setup GitHub repo; begin report draft and user stories
- Tamim: Begin UML diagrams
- Zuhor: Prepare to begin frontend scaffolding
- Hafiza: Review user manual expectations and begin framework
- Sara: Confirm participation and role

Notes:

- Project planning proceeding with active members to avoid delay in report deliverables
 - Next team check-in scheduled: Friday, 5 April 2025 (Week 5)
-

5.1.2 Week 5 Meeting Minutes

Project Title: Event Management System

Prepared by: Chelsea (Project Manager/Documentation Lead)

Date: Friday, 5th April, 2025

Time: No formal meeting conducted

Location: Discord (asynchronous discussion via text channel)

Attendees:

- Chelsea (Project Manager / Documentation Lead)

Apologies:

- Zuhor (Frontend Developer + UI Lead) - Eid
- Hafiza (QA Assistant / User Manual Coordinator) - Eid

No Response Received:

- Tamim (UML + Planning Diagram Specialist)
- Sara (Unconfirmed Team Member)

Agenda:

- Continue development and report preparation
- Create GitHub repository
- Scaffold backend and frontend structure
- Follow up on assigned roles and deliverables
- Identify risks to upcoming Progress Report (Part 1) submission

Progress Summary

Area	Decision/Action	Assigned	Status/Notes
GitHub Repository	Repo created with .gitignore, MIT license, and structured folders (frontend/, backend/, docs/)	Chelsea	Completed
Backend Setup	Initial backend scaffold created using Express (server.js) with test route	Chelsea	Completed
Frontend Scaffold	Placeholder index.html file added to initiate frontend file structure	Chelsea	Completed (awaiting handover)
User Stories	Feature-aligned user stories drafted for login, registration, and event management	Chelsea	In Progress
Development Plan	Drafted structure of Progress Report (Part 1): methodology, team roles, planning documentation	Chelsea	In Progress

UML Diagrams	No response or deliverables received	Tamim	Not started / unconfirmed status
UI Mockups	Not started; Zuhor unavailable this week due to Eid	Zuhor	Deferred (valid leave)
User Manual	Not started; Hafiza unavailable this week due to Eid	Hafiza	Deferred (valid leave)

Issues:

- Team member engagement limited this week
- No deliverables submitted by Tamim; communication unconfirmed
- Sara has not responded or acknowledged participation
- Frontend and user manual tasks deferred due to Eid
- Progress Report Part 1 deadline approaching; risk of further task compression if delays persist

Outcomes:

- GitHub repository created with project structure and license
- Backend scaffolded using Express.js (server.js initiated)
- Frontend file (index.html) created as initial placeholder
- User stories and Progress Report Part 1 sections (methodology, planning) drafted
- Team members contacted with task reminders and follow-ups

Action Items for Week 6:

- **Chelsea:** Finalise user stories; continue drafting Progress Report (Part 1)
- **Tamim:** Submit UML diagram drafts (use case + class diagrams)
- **Zuhor:** Begin frontend scaffolding (HTML layout, login/register pages)
- **Hafiza:** Begin user manual structure and planning section
- **Sara:** Confirm participation

Notes:

- Zuhor and Hafiza absent this week due to Eid; tasks deferred until Week 6
- Tamim has not provided updates or confirmed task progress
- Sara remains unresponsive as of April
- Next team check-in scheduled: Wednesday, 10 April 2025

5.1.3 Week 6 Meeting Minutes

Project Title: Event Management System

Prepared by: Chelsea (Project Manager/Documentation Lead)

Date: Friday, 12th April, 2025

Time: No formal meeting conducted

Location: Discord (asynchronous discussion via text channel)

Attendees:

- Chelsea (Project Manager / Documentation Lead)
- Tamim (UML + Planning Diagram Specialist)
- Zuhor (Frontend Developer + UI Lead)
- Hafiza (QA Assistant / User Manual Coordinator)
- Sara (Expressed interest early, no follow-up or contribution this week, but confirmed for backend)

Agenda:

- Consolidate deliverables for Progress Report (Part 1)
- Draft and begin to finalise UML diagrams
- Review frontend and backend development progress
- Confirm member roles and remaining contributions for submission
- Identify current blockers and prepare mitigation for Week 7

Progress Summary

Area	Decision/Action	Assigned	Status/Notes
GitHub Management	Repo and sprint planning fully established and updated	Chelsea	Completed
User Stories	Finalised user story list included in Progress Report	Chelsea	Completed
Backend Scaffold	Express.js server setup with test route and folder structure created	Chelsea	Completed
Progress Report Draft	Initial draft completed with methodology, user stories, and system planning	Chelsea	In Progress (80%)
UML Diagrams	Use Case and Class Diagrams submitted and iterated on	Tamim	Submitted in Discord server (clean-up pending)
Sequence Diagram	Drafted in development	Tamim	In Progress

Frontend Development	Claimed UI work underway but no screenshots, code or proof of progress provided	Zuhor	No verifiable work submitted
User Manual	Role clarified again; draft not yet started	Hafiza	No verifiable work submitted
Backend Development	No submission or confirmed work since initial role claim	Sara	No verifiable work submitted

Issues:

- Report bottlenecked by incomplete sections (UML, UI screenshots, manual)
- Some team members remain unaware of required deliverables
- Sara remains inactive post Week 5 role claim
- Task compression expected in Week 7 to ensure submission

Outcomes

- Project planning and system scaffolding completed by the PM, including GitHub repo, task board, backend setup, and full user stories
- Use Case and Class Diagrams submitted by the UML lead; revisions pending
- Progress Report (Part 1) approximately 80% complete, pending remaining visuals and UML assets
- Frontend and backend components are still in early stages; no verifiable submissions have been received yet from the assigned frontend (Zuhor or backend (Sara) developers
- Hafiza:’s role as User Manual Coordinator was clarified as support-based during early sprints; although the manual is not required for this submission, opportunities for assistance with documentation and testing were available
- Team contributions to date remain uneven, with early deliverables largely completed by the Project Manager
- Submission remains on track, assuming remaining deliverables are completed in Week 7

Action Items for Week 7:

- **Chelsea:** Finalise and submit Progress Report; Complete documentation, integrate system evidence
- **Tamim:** Finalise UML (Sequence Diagram); Submit completed sequence diagram and review others for consistency
- **Zuhor:** Submit working UI and visuals; Provide screenshots or code for login/register frontend pages
- **Hafiza:** Begin User Manual draft; Outline initial structure and gather visuals from system features
- **Sara:** Confirm backend role; Clarify status or reassign backend responsibilities as needed

Notes:

- While some roles (e.g. User Manual Coordinator) were not responsible for direct report components this week, members were encouraged to assist with broader team tasks such as formatting, testing, and documentation
 - As of this meeting, no concrete deliverables had been submitted by Zuhor or Sara
 - The Sequence Diagram and front-end demo remain key components still outstanding
 - The group aims to consolidate all final components in Week 7; submission is still planned to proceed on time
 - Next team check-in scheduled for **Wednesday, 16th April 2025**, to confirm final report sections and system outputs before submission
-

5.1.4 Week 7 Meeting Minutes

Project Title: Event Management System**Prepared by:** Chelsea (Project Manager/Documentation Lead)**Date:** Wednesday, 16th April, 2025**Time:** 7:00PM**Location:** Discord Voice Channel**Attendees:**

- Chelsea (Project Manager / Documentation Lead)
- Tamim (UML Lead / System Planner)
- Zuhor (Frontend Developer / UI Lead)

Apologies:

- Hafiza (QA Assistant / User Manual Coordinator)
- Sara (Backend Developer / System Integrator)

Agenda:

- Confirm outstanding deliverables ahead of Friday submission
- Provide frontend implementation guidance
- Clarify dummy data scripting status
- Review HTML/ERD responsibilities

Progress Summary

Area	Decision / Action	Assigned	Status / Notes
Figma Mockups	Hi-fi mockups submitted and reviewed during meeting	Zuhor	Completed
Frontend Pages	HTML implementation discussed in detail; page responsibilities clarified; PM provided guidance during meeting	Zuhor	In Progress ; drafted HTML pages (login, register, events, etc.) to be submitted before Friday
Contribution Table	Hafiza responsible for initial draft	Hafiza	In Progress ; created Google Doc with contribution table, PM unable to confirm current progress as no access during time of writing
Frontend Support	Hafiza assigned to assist Zuhor with HTML pages	Hafiza	No verifiable work submitted during time of writing

UML Diagrams	Use Case, Class and Sequence diagrams confirmed submitted; write-ups still in progress	Tamim	Completed ; case, sequence and case diagrams In Progress ; case descriptions to be completed, confirmed completion for Friday
Backend Schema (ERD)	Sara confirmed ERD responsibility earlier in week	Sara	No verifiable work submitted during time of writing
Dummy Data Script	Script development in progress	Chelsea	In Progress ; to be finalised post-formatting; working structure already set
Report Formatting	Formatting, compilation, and section integration handled by Chelsea	Chelsea	Completed ; 60+ pages of report; final screenshots and appendix pending

Issues:

- Key deliverables such as frontend implementation, backend schema, and user manual content remain incomplete ahead of Friday's submission.
- While responsibilities have been previously clarified, progress varies across roles. Some tasks have yet to be formally submitted or shared.
- Frontend and backend components are still under development, requiring close coordination in the final days before submission.
- Additional guidance and clarification were provided this week to ensure all members understand the scope and expected deliverables.

Outcomes:

- Hi-fidelity Figma mockups were submitted and reviewed; HTML structure for each core page was clarified during the Week 7 meeting.
- Use Case and Class Diagrams are completed. Sequence Diagram is in progress, with descriptive write-ups pending.
The Progress Report is largely complete (60+ pages), with final formatting, screenshots, and dummy data integration to be finalised.
- A contribution table has been drafted and is expected to be updated before submission.
- Dummy data scripting has been scaffolded and will be finalised alongside report consolidation.
- The team remains on track for submission, provided remaining tasks are completed within the outlined timeframe.

Action Items:

- **Chelsea** - Finalise dummy data script, integrate visuals and screenshots, and complete formatting and submission of the Progress Report.
- **Tamim** - Submit final UML Sequence Diagram and accompanying descriptive notes.
- **Zuhor** - Convert Figma mockups into HTML/CSS for core pages (e.g., login, register, event list); submit screenshots or files.
- **Hafiza** - Finalise draft of the contribution table; assist with frontend content blurbs and begin user manual preparation.
- **Sara** - Submit database schema (ERD) with appropriate relationships and attributes; provide any backend structural components available.

Notes:

- As of this meeting, some deliverables are still pending submission; members have been encouraged to prioritise completion and share updates via GitHub or Discord.
 - Final submission remains on track for Friday, April 18. All outstanding components are expected to be consolidated before then.
 - A final team check-in is planned for submission day to confirm completed sections and finalise documentation.
-

5.2 Signed Team Contribution Table

Compiled and finalised by PM. Based on group discussions, Discord logs, and submitted artefacts. Signed section is in the table below.

Name	Role(s)	Deliverables Submitted
Chelsea	Project Manager / Backend Architect / Docs Lead	● Authored and finalised full Progress Report (Sections 1–5) ● Drafted all user stories (formatted to INVEST standard) ● Wrote development methodology and sprint schedule ● Set up and maintained GitHub repository ● Created backend scaffold using Node.js + Express and project structure ● Wrote dummy data script and wrote appendix walkthrough ● Authored, formatted, compiled and uploaded all meeting minutes (Weeks 4–7) ● Integrated all screenshots/evidence/visual assets into report ● Compiled and formatted appendices (A-F) ● Refined ERD after team-submitted version contained significant structural and consistency issues ● Finalised contribution table, expanding and correcting the initial draft to reflect actual workload distribution and submission requirements
Tamim	UML Lead / System Planner	● Use Case Diagram ● Class Diagram ● Sequence Diagram ● Descriptive write-ups for all UML diagrams
Zuhor	Frontend Developer / UI Engineer	● Figma mockups for user and organiser flows ● HTML pages for user interface (user-side flow)
Hafiza	QA Assistant / Manual Coordinator	● HTML pages for organiser interface flows ● Drafted an initial version of the contribution table, which was later expanded and finalised by PM to ensure clarity, accuracy, and to more comprehensively reflect the breadth and distribution of team contributions in line with the project deliverables.
Sara	Backend Developer / Logic Integrator	● ERD diagram draft - Due to time constraints and unresolved relational inconsistencies, an alternate version was used for the final report. ● Provided entity descriptions, which are included in <i>Appendix A4</i> for reference and documentation support.

As mentioned, a preliminary version of the contribution table was initially drafted by the QA assistant and is included in *Appendix F* for reference.

Chelsea Okan (8438675)		co345@uowmail.edu.au
Tamim Draz (9629981)	Tamim	tksad974@uowmail.edu.au
Zuhor Heish (7280312)		zh922@uowmail.edu.au
Hafiza Ayesha Noor (6849635)	Ayesha Noor	hafizaayeshanoor902@gmail.com
Saira Rahman (8056663)		sara.adhisa@gmail.com

3. APPENDIX

3.1 Appendix A - ERD + Database Schema

A1. Finalised schema used for development

A2. Separate ERD submitted by Sara (Backend Developer), not used due to structural and relational inconsistencies.

mommy 22:33
is this your finalised version or you just showing me progress?

sara.hr 23:03
This is the finalised one

mommy 23:06
ok so
There are some typos in field names that might confuse the marker:
 • category → should be category
 • serch_timesrapd → likely meant to be search_timestamp
 • Ticking and Ticket → unclear naming and possibly duplicates of Ticket

Some tables are missing key foreign keys or aren't linked properly:
 • Booking should link to both user_id and event_id
 • Payment doesn't show a foreign key to Booking, even though it says FK
 • Notification lists event_id but it's not connected to Event
 • Report uses organizer_id as its primary key, but it should probably be a foreign key with its own report_id

The ticketing structure is unclear, with multiple entities (Ticking, Ticket, Ticket) but no clear flow or purpose

Some foreign key relationships are labelled but not actually drawn, which makes the diagram harder to interpret

There's no field consistency (e.g., created_at is in some tables but missing in others like Booking)

if you're not able to make these changes, I've already put together a clean version of the ERD as a contingency. I'll include your version in the appendix for transparency, along with what I'm assuming was the description you wrote earlier.

Just wanted to keep you in the loop before I finalise everything for submission.

sara.hr 23:18
Okay that will be better
Thank you

A3. Screenshots included here demonstrate that the alternate ERD was submitted less than two hours before the final report deadline, despite feedback and multiple follow-up requests. As a result, there was insufficient time to correct or integrate the submission into the report. These messages are included for transparency and to show that all efforts were made to accommodate team contributions. Please note the timestamps on each message.

User: Represents individuals interacting with the system, storing personal details like first name, last name, email, and contact information, along with security credentials. Each user can have multiple addresses and can organize events, make bookings, and receive notifications.

Event: Captures details about organized gatherings, including title, description, category, location, schedule, pricing, capacity, and status. Events are organized by users and can have multiple bookings associated with them.

Booking: Records reservations made by users for events, specifying the role, ticket type, booking date, payment status, and ticket code. Each booking is linked to a specific event and a client (user).

Payment: Tracks financial transactions related to bookings, including amount, payment method, payment date, transaction reference, and status. Payments can be categorized and may have associated date ranges, and each payment is linked to a booking.

Address: Stores location information for users, including street, city, state, country, and zip code. Each address is associated with a specific user.

Notification: Holds messages sent to users, potentially related to specific events, and includes information about the message content, status, and creation date. Notifications are directed to individual users.

Report: Contains summaries of event data, generated by organizers, including total and VIP/general ticket counts and total revenue. Each report is associated with a specific event and organizer.

Account: Manages financial accounts for users, tracking category and balance. Accounts are associated with both a user and a client.

Filter: Stores criteria for filtering account data, such as date ranges and search timestamps. Filters are applied to specific accounts.

A4. Entity Descriptions by Sara (Backend Developer) Written descriptions were provided by the backend developer to accompany the database schema. These were intended to outline the purpose of each entity.

3.2 Appendix B - HTML Frontend (Static Pages)

Screenshots of rendered static HTML pages developed for the Event Management System. These were designed based on Figma mockups and demonstrate basic frontend scaffolding for user interaction.

3.2.1 User Interface HTML pages

The screenshot displays a login interface on a light gray background. At the top center, there is a small rectangular box containing a question mark icon. Below this, the text "Welcome Back!" is centered in a bold, black font. The main login form is a white rounded rectangle with a subtle shadow. It contains two input fields: "Email" and "Password", each with a teal eye icon on the right side. Below these fields is a solid purple button with the text "Sign in" in white. At the bottom of the form, there are two lines of text: "Don't have an account? [Sign up](#)" and "Organiser? [Click here](#)".

3.3 Appendix C - Dummy Data Script

Excerpt from the `dummy_data.js` script used to populate the backend with mock data for users and events. This script supported initial backend testing and database schema validation.

```
1 // generate_dummy_data.js
2 // hi team (and tutor, if you're reading this lol)
3 // this script generates mock organisers, events, and bookings for our CSIT314 project!
4 // it's built with @faker-js/faker, which lets us spit out data that *looks* real (but don't worry, it's not)
5 // **NOTE** if you're testing with this on your own laptop and it's not working, run:
6 // npm install @faker-js/faker
7
8 const { faker } = require('@faker-js/faker');
9
10 const organisers = [];
11 const events = [];
12 const bookings = [];
13
14 // make 10 event organisers because honestly 1 or 2 was not gonna cut it
15 for (let i = 1; i <= 10; i++) {
16   organisers.push({
17     id: `org${i.toString().padStart(3, '0')}`,
18     name: faker.person.fullName(),
19     email: faker.internet.email(),
20     password: faker.internet.password(12),
21     role: 'organiser',
22   });
23 }
24
25 events.push({
26   id: `event${i.toString().padStart(3, '0')}`,
27   title: `${faker.music.genre()} Night at ${faker.location.city()}`, // very real very authentic
28   description: `Join us for a night of ${faker.music.genre()} featuring ${faker.person.fullName()} and other local legends.`,
29   date: faker.date.future().toISOString(),
30   location: faker.location.city(),
31   organiserId: `org${i.toString().padStart(3, '0')}`,
32   capacity: faker.number.int({ min: 80, max: 300 }),
33   ticketsAvailable: faker.number.int({ min: 10, max: 300 }),
34 });
35
36 // bookings. 50 of them. because why not.
37 for (let j = 1; j <= 50; j++) {
38   bookings.push({
39     bookingId: `bk${j.toString().padStart(3, '0')}`,
40     userId: faker.internet.username(),
41     eventId: `event${faker.number.int({ min: 1, max: 10 }).toString().padStart(3, '0')}`,
42     status: faker.helpers.arrayElement(['confirmed', 'pending', 'cancelled']),
43   });
44 }
45
46 // proof-of-life preview!! if you're screenshotting, you're good with this slice
47 console.log('\n Sample Organisers:\n', JSON.stringify(organisers.slice(0, 2), null, 2));
48 console.log('\n Sample Events:\n', JSON.stringify(events.slice(0, 2), null, 2));
49 console.log('\n Sample Bookings:\n', JSON.stringify(bookings.slice(0, 5), null, 2));
50
51 console.log('\n Dummy data successfully generated. Add to CI/CD pipeline for seeding and auto-testing. Love you, bye :D');
52
```

Figure C1 (top) and Figure C2 (bottom)

Preview of the `generate_dummy_data.js` script authored by Chelsea (PM). Script generates mock organisers, events, and user bookings in alignment with test case requirements.

```

Dummy data successfully generated. Add to CI/CD pipeline for seeding and auto-testing. Love you, bye :D

```

Figure C3

Console output sample from running the script via node generate_dummy_data.js, showcasing valid dummy data and successful execution. Also doubles as irrefutable proof that yes, this was in fact tested and functional.

Dummy Script Usage Guide

Written by: Chelsea (Project Manager)

What's this script for?

generate_dummy_data.js is a script that creates 10 organisers, 10 events, and 50 bookings using the [@faker-js/faker](https://www.npmjs.com/package/@faker-js/faker) library. It is meant to simulate realistic test data and is useful when testing for backend routes, populating a database or mocking outputs in system development.

! Prereqs !

To run this script, you'll need:

- Node.js installed on your machine.
Download: <https://nodejs.org>
- A terminal that can run commands (Command Prompt, Terminal, etc.)

To set yourself up (I'm writing this with the assumption you're on Windows):

1. Open Terminal
 - 1.1. On Windows, press Windows + R
 - 1.2. Type cmd
 - 1.3. Press enter
2. Navigate to the folder with the script
 - 2.1. `cd path\to\where\generate_dummy_data.js\is`
3. Install Faker (only once)
If this is your first time using the script, run:
 - 3.1. `npm install @faker-js/faker`
4. This will create a node_modules/ folder and install the faker dependency locally.
E.g. My desktop looks like this:

Running the Script

1. Once in the correct folder and faker is installed, run in your Command Prompt:
 - 1.1. `node generate_dummy_data.js`

You'll then see output like this:

```
C:\Users\G1449\Desktop>node generate_dummy_data.js

Sample Organisers:
[
  {
    "id": "org001",
    "name": "Leonard Torphy",
    "email": "Milton.Johnston5@yahoo.com",
    "password": "ez3ItaiqWfot1l",
    "role": "organiser"
  },
  {
    "id": "org002",
    "name": "Carol Halvorson II",
    "email": "Melyssa_Kerluke@yahoo.com",
    "password": "DoVSofAWN8Scfab",
    "role": "organiser"
  }
]

Sample Events:
[
  {
    "id": "event001",
    "title": "Psychedelic Night at East Allyfurt",
    "description": "Join us for a night of High Classical featuring Roberta Cronin and other local legends.",
    "date": "2026-01-19T00:26:42.964Z",
    "location": "Reingerfurt",
    "organiserId": "org001",
    "capacity": 115,
    "ticketsAvailable": 192
  },
  {
    "id": "event002",
    "title": "Post Dubstep Night at Sheboygan",
    "description": "Join us for a night of Acid House featuring Jordan Kling and other local legends.",
    "date": "2025-11-21T20:02:30.096Z",
    "location": "Leuschketown",
    "organiserId": "org002",
    "capacity": 107,
    "ticketsAvailable": 267
  }
]

Sample Bookings:
[
  {
    "bookingId": "bk001",
    "userId": "Byder.Hackett",
    "eventId": "event001",
    "status": "confirmed"
  },
  {
    "bookingId": "bk002",
    "userId": "Sineon.Hill1",
    "eventId": "event003",
    "status": "cancelled"
  },
  {
    "bookingId": "bk003",
    "userId": "Edwardo.Stokes57",
    "eventId": "event001",
    "status": "confirmed"
  },
  {
    "bookingId": "bk004",
    "userId": "Spencer.Littel02",
    "eventId": "event006",
    "status": "pending"
  },
  {
    "bookingId": "bk005",
    "userId": "Luz20",
    "eventId": "event002",
    "status": "cancelled"
  }
]

Dummy data successfully generated. Add to CI/CD pipeline for seeding and auto-testing. Love you, bye :D
```

Expected output format should look like:

- Organisers - Array of organiser objects with IDs, names, emails and roles
- Events - Each linked to an organiser, with titles, capacity, location, and date
- Bookings - 50 random bookings, linked to users and events

Only a preview is logged, but you can modify the script to log/export all of the data if needed.

Do note that: You can edit the numbers in the for loops if you want more/less test data

Figure C4 and C5 Quick-start PDF guide walking through script execution, including npm install instructions for those without Faker installed.

3.4 Appendix D - Figma UI Mockups

High-resolution screenshots from the Figma project, covering both user and organiser interface flows. These visual plans were used to guide frontend development and align with sprint tasks.

3.4.1 User Interface Mockups

The mockup shows a login page with a light gray background. At the top center is a rounded rectangular button with the text "Logo". Below this is the heading "Welcome Back!" in a bold, black, sans-serif font. Under the heading are two input fields: the first is labeled "Email address" and contains the placeholder text "Enter your email"; the second is labeled "Password" and contains the placeholder text "Name". Below these fields is a large, dark green button with the text "Sign in" in white. At the bottom, there is a line of text: "Dont have an account? [Sign up](#)" followed by "Organizer? [Click here](#)".

Figure D7. Edit Profile - Form for updating organiser details

The form is part of a multistep process with four steps: Edit, Banner, Ticketing, and Review. The 'Edit' step is currently active. The form includes fields for Session(s), Start Date (DD/MM/YY), Start Time (12:00 AM), and End Time (12:00 AM). There is a Location dropdown menu with the placeholder text 'Please select one'. Below this is an 'Additional Information' section with a text area for the 'Event Description' and a 'Save & Continue' button.

Figure D8. Create Event - Multistep form (event info, image upload, ticketing

The dashboard is titled 'Events organized by you' and is divided into two sections: 'Upcoming' and 'Previous'. Each section contains three placeholder cards. Each card has a 'Title:' label and a pencil icon for editing.

3.5 Appendix E - GitHub Commit Log

Snapshot of Git commit history from the csit314-event-management-system repository. Upon time of screenshot there are 61 commits.

Number of commits per member:

- **Chelsea** (PM): 50 commits
- **Tamim** (UML Lead / System Planner): 2 commits
- **Zuhor** (Front End Developer / UI Engineer): 9 commits

*There have been no commits from **Hafiza** or **Sara**

The screenshot displays the GitHub commit log for the 'main' branch. It shows a list of commits grouped by date. The commits are as follows:

Date	Commit Title	Author	Commit Hash
