

Week 13 Meeting Minutes

Project Title: Event Management System

Prepared by: Chelsea (Project Manager/Documentation Lead)

Date: Thursday, June 5, 2025

Time: No formal meeting conducted

Location: Discord (asynchronous updates and check-ins throughout the week)

Attendees:

- Chelsea (Project Manager / Documentation Lead)
- Hafiza (QA Assistant / User Manual Coordinator)
- Sara (Backend Developer / System Integrator)
- Tamim (UML Lead / System Planner)
- Zuhor (Frontend Developer / UI Lead)

Agenda:

- Final documentation updates
- Backend code verification
- User Manual rework
- System walkthrough simulation
- Test & Run Guide ownership
- Final submission preparation

Progress Summary

Area	Decision / Action	Assigned	Status / Notes
Final Report Assembly	Ongoing formatting and insertion of screenshots, code samples, and integration notes	Chelsea	In progress; all work dependent on backend updates
Backend Feature Confirmation	PM updating documentation based on claimed implementations	Chelsea	Confirming with Sara/Zuhor

User Manual	Rewriting entire manual from PM-provided example	Hafiza	Incomplete; was given a full structure and style guide
System Functionality (Backend)	Supposedly being refined and patched	Sara	Unverified; no evidence of commits or updated integration
Organiser Backend Fixes	Editing and resubmitting non-functional organiser routes	Zuhor	Claimed in chat; verification pending
Test & Run Guide	Creation and formatting	Tamim	Still pending; PM may step in if incomplete

Issues Identified:

- Backend still not integrated or tested live; system walkthrough simulated via screenshots (??)
- User manual incomplete; full rewrite needed
- Unclear communication on which features are actually functioning
- Test & Run Guide remains unsubmitted

Outcomes:

- PM will finalise the entire documentation submission and complete any missing pieces not delivered
- Team has acknowledged documentation priority over functionality due to time constraints

Action Items:

- Chelsea: Finalise report; screenshot all functional outputs; format entire document for submission
- Hafiza: Submit rewritten user manual
- Tamim: Provide Test & Run Guide formatted and linked into appendices
- Zuhor: Confirm organiser edit functionality
- Sara: Push final backend code fragments and confirm implemented logic

Notes:

User Manual

Introduction

Welcome to DelivEase! Our application transforms the way you place restaurant orders by offering a smooth and extensive selection of eateries. DelivEase was created to make ordering takeout easier. It puts variety, convenience, and enjoyment right at your fingertips. Say goodbye to long queues and complicated ordering processes, and hello to delicious meals delivered straight to your door.

Installation

Our application is an online website. So, it can be used from both mobile and computer.

- Browser Compatibility

o Our app is compatible with all modern web browsers, including Google Chrome, Safari, Firefox, and Microsoft Edge.

- Software Version

o Make sure you're running the latest version of our app to access all the latest features and improvements.

Brief guideline

When you first open the website, you will be in the homepage and in order to start ordering, you need to login/register. Once logged in you can:

Account registration and login

Users (Attendees and Organisers) can create an account using their email and password. Login allows secure access to personalised dashboards.

User authentication and session handling

The system validates user credentials and maintains active sessions until the user logs out.

Event discovery with filtering

General users can browse and search for events using various filters like date, type, or location.

Filtering by category, date, location, etc.

Advanced filtering options help users find events that match their preferences.

Event booking and ticket generation

Users can book tickets for events. Once booked, a ticket is generated and available for download or view.

Figure 1: Screenshot of Original User Manual Draft Submitted by Hafiza. This version references an unrelated application ("DelivEase") and includes installation instructions irrelevant to a browser-based static site. The content structure and tone are inconsistent with the system's actual implementation and user roles.

The screenshot shows a GitHub issue thread. At the top, a user with the handle @Hafiza comments: "Also plz let me know if any changings are required". Below this, a user named mommy (with a cat profile picture) responds at 08:58: "Hey, so no this needs to be completely re-written from the ground up." The main body of the issue contains the following text:

The user manual needs to clearly cover all three user roles:

- Admin
- General Users (with a sub-section for VIPs - but only if there are actual implemented features for VIPs)
- Organisers

We can include screenshots of the frontend but only if they're actually supported by the backend now. If buttons or flows are still mockups or non-functional, there's no point including them yet.

1. The Introduction

2. This section needs a full rewrite to reflect the actual product.

3. Right now, it's not just wrong - it's about a completely different app ("DelivEase"???) which has nothing to do with our platform. No slogan-style filler.

J- ust a clear, direct explanation of what the platform does, who it's for, and what users can expect to do with it.

2. Installation Section

3. This entire section is redundant.

4. Saying "make sure you're running the latest version" makes no sense — we're hosting a static site. There are no updates for users to install.

Rename this to Access Requirements, and include:

- Supported browsers (Chrome, Edge, Firefox, Safari)
- That the platform is browser-based and doesn't require any downloads

3. "Brief Guideline"

Needs to be completely cleaned up - both in structure and tone.

Rework this as a Quick Start Guide - just a simple list of the general user flow to get started.

Figure 2-3 : PM Feedback on User Manual Comprehensive rewrite instructions provided by Chelsea. The feedback outlines the misalignment of the current manual with the project scope, rejects the inclusion of non-user-facing backend features, and mandates a restructure by user role (Admin, Organiser, General User).

- Check email for confirmation and ticket
- View bookings in the dashboard

That's it. No backend/system-level implementation notes belong here. Users don't need to know about session handling, form logic, or token auth.

4. The Midsection: Feature Dump

This is where the whole thing derails — what you've written here is no longer a user manual, it reads like a developer handover document.

Things like:

"User authentication and session handling"
"Payment gateway integration (placeholder)"
"Test data generator script"
"CI/CD pipelines"
"Dummy support form"

These are not user-facing features and should be cut completely. The manual is for people using the system, not building it. The dev-specific notes are for our backend documentation, which is what would be said in our test and run guide.

5. User Role Sections

This is what the majority of the document should actually be focused on. Each role should get its own section explaining what they can see and do on the platform. Keep the focus on actions, not system processes.

- General Users: browsing, filtering, booking, viewing tickets, receiving emails
- VIP Users (if they exist): what's different about their booking or access experience
- Organisers: event creation/editing, managing attendees, sending updates, analytics
- Admins: moderating content, managing users, approving organiser roles, etc

Don't mix these roles up. Each section should be clearly labeled and scoped so users can skip to what's relevant to them.

6. Structure, Tone, and Visuals

7. The document is missing a clear structure or Table of Contents. Users need to be able to jump to what they need.

TL;DR:

The current draft is trying to be a user guide, marketing doc, and dev log at the same time, and ends up being none of them. You need to strip it back and refocus it as a proper user manual: clean, direct, scoped by user role, and backed up with only the features that actually exist.
also the user manual does need actual visual aids and screenshots
