

User Stories – CSIT314 Event Management System

Version 2.0

Written by: Chelsea (Project Manager/Documentation Lead)

Last edited: 16th April 2025

Purpose: This document outlines the core user stories for the Event Management System. It is structured to support our chosen agile methodology and incremental delivery across the defined user roles. Each story was written to reflect the specific system functionality from an end-user perspective and adheres to INVEST principles (Independent, Negotiable, Valuable, Estimable, Small and Testable).

1.2 Format Standard

Each user story follows the format:

“As a [type of user], I want to [goal] so that [benefit].”

1.3 Actor Overview

This project includes the following user types:

- General Users (attendees)
 - Event Organisers
 - System (backend operations)
 - Administrators
-

1.4 User Stories by Actor

1.4.1 General Users

Users interact with the platform primarily to register, browse, and attend events. Their experience should be seamless, intuitive, and responsive across all devices.

- As a user, I want to register for an account so that I can access personalised features.
- As a user, I want to log in and log out securely so that I can protect my account information.
- As a user, I want to view upcoming events so that I can choose which ones to attend.

- As a user, I want to search and filter events by date, type, or location so that I can find relevant options quickly.
- As a user, I want to register or purchase tickets for events so that I can confirm my participation.
- As a user, I want to view a history of events I've registered for so that I can track my engagements.
- As a user, I want to receive email or in-app notifications about event changes or confirmations so that I stay updated.

1.4.2 Event Organisers

Organisers use the platform to manage event creation, attendee lists, and real-time updates. Their interaction must support efficient content creation and administrative control.

- As an organiser, I want to log in to my organiser account so that I can manage my events.
- As an organiser, I want to create new event listings so that users can see what I'm offering.
- As an organiser, I want to edit or cancel events so that I can keep information accurate.
- As an organiser, I want to view the list of attendees per event so that I can prepare accordingly.
- As an organiser, I want to send event updates to registered users so that they stay informed.
- As an organiser, I want to generate basic reports on event attendance so that I can evaluate
- success.

1.4.3 System-Level Functionalities (*Non-Human Actors*)

These user stories reflect core system operations required to support user-facing features. Though they aren't user-initiated, they are still essential to functional integrity.

- As the system, I must validate user input on all forms so that data is consistent and error-free.
- As the system, I must send confirmation emails after registration or ticket purchases so that users receive proof of action.
- As the system, I must implement secure authentication so that user data is protected.
- As the system, I must provide role-based access so that users only access relevant features.
- As the system, I must log user interactions so that audit trails are maintained.

1.4.4 Administrators

Administrators manage system integrity and user governance.

As an admin, I want to monitor system-wide activity so that I can ensure smooth operations.

- As an admin, I want to review and moderate events so that I can remove inappropriate or duplicate content.
 - As an admin, I want to manage user accounts so that I can suspend or deactivate as necessary.
-

1.5 Document Note

- This user story list is expected to evolve with stakeholder feedback and ongoing sprint retrospectives (i.e. changes in the Rubric or any updates from the Subject Coordinator)
- Non-functional requirements (e.g. performance, usability, accessibility) will be addressed separately (should it be required in the final submission).
